To whom it may concern

Testimonial on the assistance and benefits received from the TLIU

From the start of this project, to install a robotic welder in order to assemble transformer radiators, the TLIU supported us significantly and up to now it was a great experience and privilege to work with the TLIU.

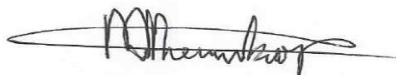

Silverton Engineering will only benefit by working with the TLIU and their competent staff. In the future the robotic welder will do most of the welding and will ensure that the current welding staff can be employed in other departments of the company if needed, to optimize the usage of the employees.

The installment of the robotic welder will ensure a definite improvement on the quality of the transformer radiators, since the parts to be assembled have to be precise and consistent. The final product as well as the welding will be more consistent and will then automatically improve the cosmetics of the transformer radiators. The welding process, with the robotic welder, will be more controlled which will ensure lesser welding spatter and cleaning afterwards, thus the production time will be decreased significantly and enable Silverton Engineering to produce more units and to satisfy all the customers' needs.

Since such a project goes hand in hand with very high expenses it is a privilege to say that the TLIU supports Silverton Engineering significantly on this regard and made this project financially possible. At the end by, implementing new technologies, the company image will be lifted.

In the nearby future Silverton Engineering will definitely launch new projects, where the assistance of the TLIU will be much appreciated and needed.

Yours sincerely

Martin van Nieuwkoop
